Paper Title

AI-Powered Enterprise Meeting Intelligence and Action Tracking Platform

Abstract

Many organizations hold meetings to discuss projects; assignments and progress on said projects are assigned and tracked. Such meetings often require taking notes and recording action items, which can be tedious and timeconsuming, resulting in missed action items, vague instructions, and poor collaboration, for example, when meetings are held with colleagues on the go; with spotty internet access; or in which taking notes is otherwise difficult. The proposed AI-Powered Enterprise Meeting Intelligence and Action Tracking Platform would serve to address this need while enabling easy processing of action items, summarization of discussions, and tracking of these items. The proposed platform would be used for both online and offline meetings. It would take an audio file of the meeting and process it with Artificial Intelligence to identify and extract action items, noting who is responsible for them and any relevant deadlines. Information would be presented in an easy-to-use interface, with meeting history and search functions available, and users could be reminded of tasks. The proposed system would make it easy and intuitive for enterprises to increase employee productivity and collaboration, by transforming natural language discussions into actionable items that move projects forward, and ensuring that nothing is forgotten. The system would be organized around a web interface and would be used in a variety of collaboration settings.
